

Financial Data Cleaning & Transformation Project Documentation

Executive Summary

This project demonstrates an end-to-end Microsoft Excel data cleaning workflow on a banking dataset containing over 25,500 records.

Business Problem

The raw dataset contained duplicate records, missing values, inconsistent formatting, invalid emails, mixed date formats, and inconsistent bank names.

Objectives

Improve data quality, remove duplicates, standardize values, validate records, and prepare data for analytics.

Methodology

Inspect data → Remove duplicates → Handle missing values → Standardize → Validate → Quality assurance → Clean dataset.

Metric	Value
Original Records	25,500
Duplicates Removed	1,838
Tool	Microsoft Excel
Output	Analysis-ready dataset

Business Impact

Improved data quality, reporting accuracy and readiness for dashboards, SQL and Power BI.

Skills

Data Cleaning, Data Validation, Excel, Data Transformation, Business Intelligence.

Future Enhancements

Power Query, PostgreSQL, SQL validation, Python ETL, Power BI.
